

If your remediation technology fails, do your vendor's claims go down the drain?

- "Poor results with simple carbon-only injectable substrates?"
- "Increased cis-DCE and VC concentrations instead of complete removal?"
- "Problems with mobilization of arsenic?"

Time to switch to EHC[®], the only integrated source of carbon, nutrients and ZVI.

At Adventus, we don't leave our partners high and dry with less-than-optimal remedial solutions. We offer unique, performance-based contracts to help you achieve your clean-up goals. Our risk-sharing comes in two primary forms:

1. Groundwater Remediation "Performance Warranties":

EHC[®], EHC-M[™] and EHC-O[™] have been used to successfully treat millions of gallons of impacted groundwater globally.

2. Soil Remediation "Performance Guarantees":

DARAMEND[®] has been used around the world to successfully treat over 3,000,000 metric tons of soils, sediments and sludge.

Unlike other products, the unique remediation capabilities of our patented *In Situ* Chemical Reduction (ISCR) biotechnologies mean:

- NO mobilization of arsenic or other heavy metals
- NO metabolite accumulation (such as DCE or VC)
- NO need for extensive "water chase" ("remediation" via dilution and displacement)
- NO change in pH, or additional buffers required

Partner with us today, and discover why Adventus Group has become the bioremediation technology provider of choice.
